

ARTYOM FEDOROV

Junior Unity Developer · Gameplay Systems & Mobile Development

ABOUT / CAPABILITIES

Gameplay systems.
Technical problem-solving.
Independent development.

Unity/C# developer and Computer Science student focused on **designing, building and evolving gameplay systems**. I enjoy turning game ideas into working features, reasoning through technical problems and improving projects through **debugging, profiling and iteration**. Excavate! is my main project and the clearest example of my independent development work.

GAMEPLAY SYSTEMS

Object-oriented C#/Unity development, player interactions, progression, enemy behavior and the New Input System.

MOBILE APPLICATIONS

Android builds, Unity UI, Firebase, PlayerPrefs, JSON, URP, profiling and testing on physical devices.

DEVELOPMENT WORKFLOW

Debugging, prototyping, Git/GitHub, editor tools, Blender and AI-assisted development with Codex.

SELECTED PROJECTS / 01

Excavate! / 01

Jul 2026 – Present

Solo Unity Developer · Active development

3D hybrid-casual Android game where the player clears dense destructible environments, collects resources, upgrades tools and uncovers archaeological finds.

~5,000

interactive objects

60 FPS

Samsung Galaxy A22

EDITOR TOOL

custom scattering workflow

- Built a chunk-based destructible environment system for dense zones containing ~5,000 interactive objects.
- Implemented the core gameplay loop: player movement, automatic tool interaction, destruction, resource collection, progression and upgrades.
- Used Unity Profiler to isolate GPU bottlenecks and reach stable 60 FPS on a Samsung Galaxy A22 by optimizing materials, shaders, shadows, draw calls, Render Scale and URP settings.
- Built and integrated an AI-assisted Unity Editor scattering tool with weighting, density controls, preview and deterministic regeneration.

TECH

Unity 6 · C# · Android
Unity Profiler · URP
New Input System · Unity UI
Editor Tools · Git/GitHub

PROJECTS / CONTINUED

ARTYOM FEDOROV
UNITY DEVELOPER

CATastrophe

Solo Unity Developer • Prototype • Apr 2026 – Jun 2026

Survivors-like prototype driven by recruiting and strengthening a growing cat squad.

- Designed squad recruitment, group control and coordinated following.
- Implemented enemy spawning, combat, damage/destruction and in-session progression.
- Built custom crowd steering that combined player following, local avoidance and separation instead of relying on Rigidbody-driven movement.
- Used object pooling to reuse enemies and reduce repeated instantiation and destruction during gameplay.

Tech: Unity, C#, custom crowd steering, object pooling, Git/GitHub

Gamified Todo App

Solo Unity Developer • Feb 2026

Gamified Android task manager with rewards, local persistence and Firebase-backed cross-device synchronization.

- Implemented the complete application flow with Unity UI, including task creation, reward collection and progress tracking.
- Implemented local persistence with PlayerPrefs and cross-account/device synchronization with Firebase.
- Profiled UI rendering with Unity Profiler and optimized Canvas structure, overdraw and Sprite Atlases, reducing draw calls from **~60 to 13**.
- Tested and debugged Android builds on physical hardware.

Tech: Unity, C#, Unity UI, Unity Profiler, Firebase, PlayerPrefs, Sprite Atlas, Android

ENGINEERING APPROACH

01 • SYSTEM DESIGN

Separate gameplay responsibilities and avoid unnecessary direct dependencies as systems grow.

02 • IMPLEMENTATION

Turn mechanics into playable systems, then expand them through iteration.

03 • DEBUGGING

Trace behavior through code and verify assumptions before changing systems.

04 • PROFILING

Use Unity Profiler to confirm bottlenecks and validate improvements when needed.

EDUCATION

Northwestern Polytechnical University

B.Sc. Computer Science
Expected 2029

LANGUAGES

Russian — Native
English — B2
Chinese — B1
